

## Electronic Gradebook

We need an electronic **grade-book** to read the **grades** of an **individual student for  $n$  subjects ( $3 \leq n \leq 10$ )** and then **compute** some simple **statistics** from the grades. The grades are entered as **floating-point** numbers from **0 to 100** and the statistics should show us the **highest grade, the lowest grade, and the average grade** of that student among those  **$n$  subjects**.
